Engineering and Information Technology, M.S.

Career Advancement

The M.S. degree will assist those who need to learn more about the career areas in which they currently work. Practicing engineers whose expertise is outside of the computing and information technology area may need to gain additional knowledge in areas such as software engineering, networking, databases, and computer security. Likewise, engineers with expertise in traditional computer-related areas may need to broaden their skill set to include an understanding of the internet of things (IoT), machine learning, and other smart-system technologies and methodologies.
